**Sharks & Rays**

Conserving the chondrichthyan flukes (Sharks, Rays, Skates and Chimeras) of the Mediterranean Requins & Raies de la Méditerranée

**Conservation des poissons cartilagineux (requins, raies et Chimeres)**

The Mediterranean Sea is home to 86 species of sharks, rays, skates and chimeras (cartilaginous fish or Chondrichthyes). These animals have inhabited the seas for more than 480 million years, and many of their populations are in the process of becoming extinct as a result of human activities that threaten their survival. We need to conserve these species and their habitats to maintain the rich biodiversity of marine ecosystems and ensure the sustainable management of their populations.

To achieve this, international efforts are needed. The Mediterranean region is home to some of the world's most diverse and important shark populations, which are threatened by overfishing, habitat loss, and pollution. The conservation of these species is crucial for the health of the Mediterranean ecosystem, which in turn affects the global environment.

**Alaska Ragged Tooth Shark**

*Sharks & Rays* operates with the help of a team of experts from different fields, including marine biologists, conservationists, and environmentalists. The organization works to raise awareness about the importance of shark conservation and to promote sustainable fishing practices. It also supports research and monitoring efforts to better understand the population status of sharks and other marine species.

**Alopias vulpinus**

*Sharks & Rays* works closely with national and international organizations to develop and implement conservation measures. It collaborates with governments, fishing communities, and other stakeholders to ensure the long-term survival of sharks and other marine species.
